

F# User Defined Exceptions

In F#, you can create user defined exception. It provides flexibility to define custom exceptions according to requirement. Let's see an example.

```
exception InvalidAgeException of string
let validate x =
    if (x < 18) then
        raise (InvalidAgeException "Sorry, Age must be greater than 18")

let TestUserDefinedException =
    try
        validate 15
    with
        | InvalidAgeException(e) -> printfn "%s" e
    printfn "Rest of the code"

TestUserDefinedException
```

Output:

```
Sorry, Age must be greater than 18
Rest of the code
```
